UiPath Automation Hub

What it is?

UiPath Automation Hub is a collaborative tool for automation opportunity identification, pipeline management and process repository. It is meant to accelerate the adoption of RPA across an organization by creating a Community of Interest for RPA, thus putting employees in the drivers' seat of automation initiatives.

Automation Store in Automation Hub allows business users to browse and search for ready-made automation that can be downloaded and used. The selected automation is sent to the user's personal workspace in Orchestrator.

Why you need it?

Most of you have seen how RPA can offer a competitive advantage in today's fast-moving business environment. Still, many organizations struggle with unlocking automation's full potential.

In order to truly scale automation, your organization needs 3 things:

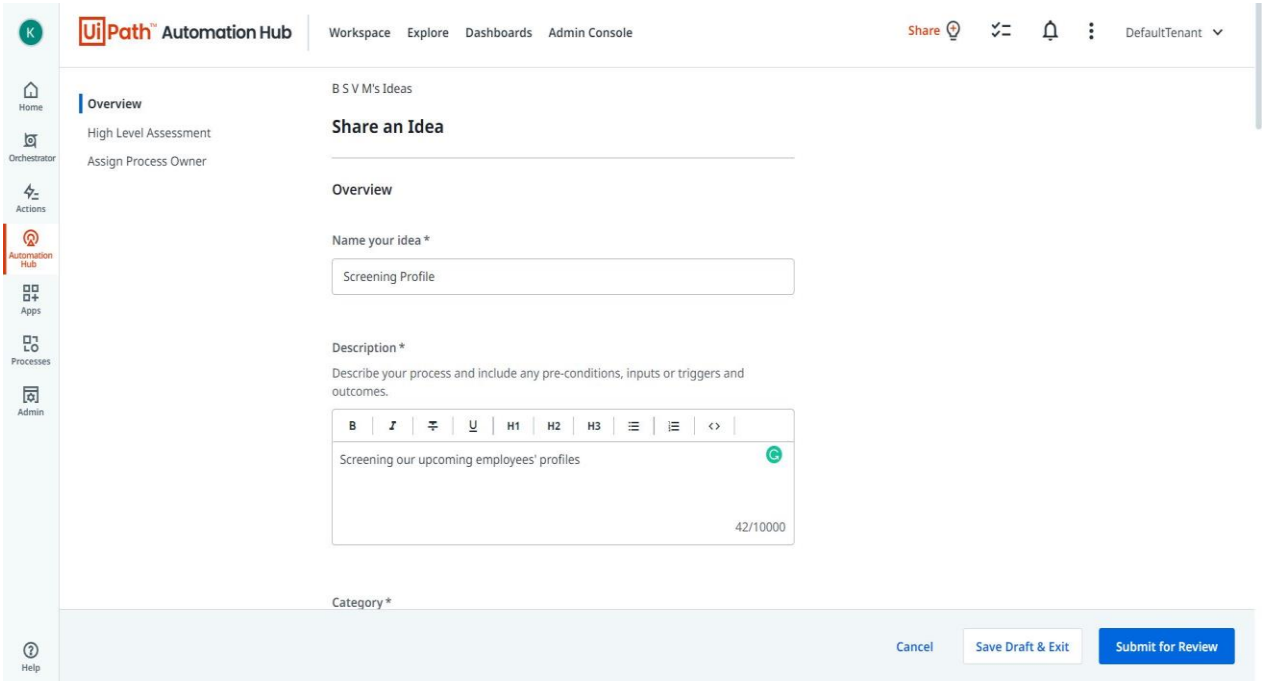
*All the right people contributing to the automation program - the Center of Excellence team, IT, the Citizen Developers, and the business users.

*A common framework and language around RPA, from workflows to best practices and governance.

*Coverage of the entire automation lifecycle in one place - from the opportunity identification phase to implementation, supplemented by storage of the related documentation and a way to leverage the reusable code.

****Turning ideas from anywhere and everywhere in your organization into automation with more control, faster implementation and impact.

- Login to AutomationHub (https://www.uipath.com/product/automation-hub)
- If you want to share an idea you can select the option share and if you are an employee of the company select ‘’share an idea” option. After that you need to fill the details as shown in the below pic

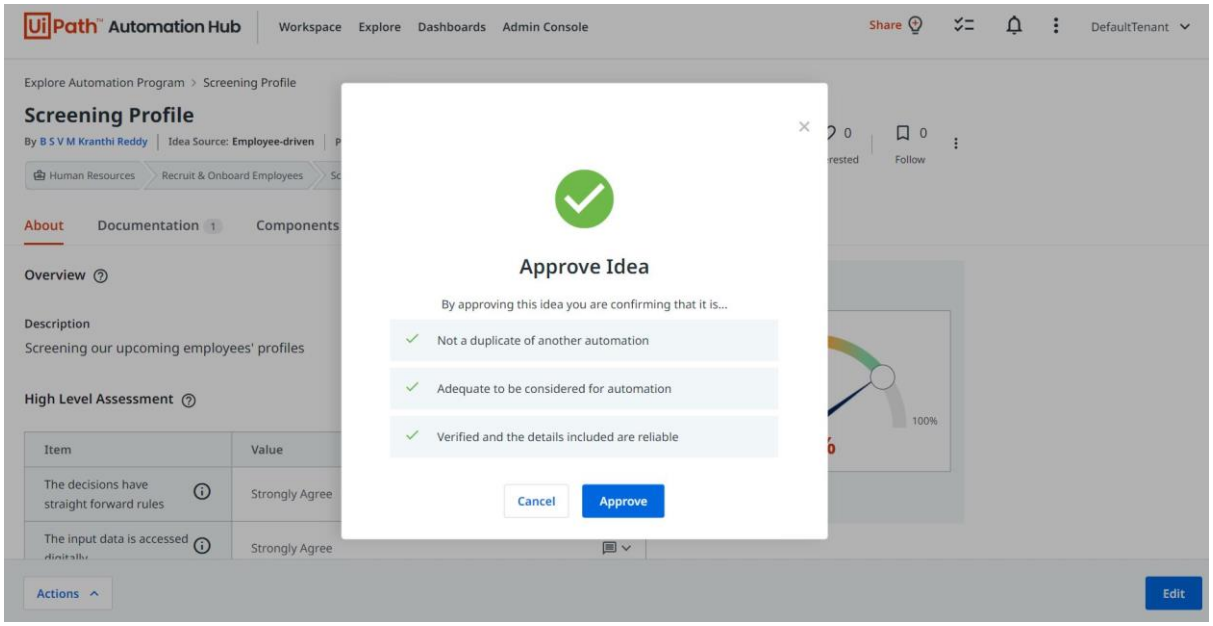


- After that click on submit for review and it saves your changes.

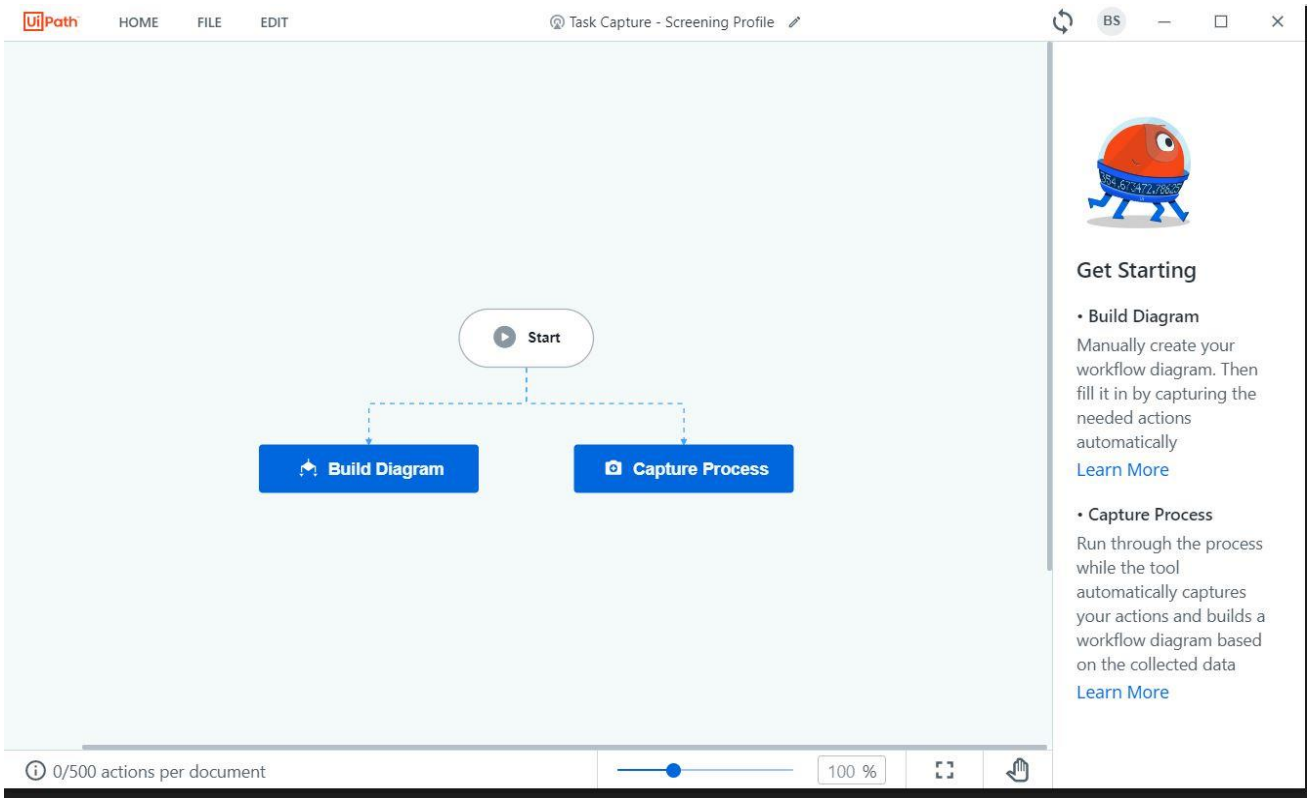
Task Capture :-

- Capture automation ideas as they arise. Manage and track them in one place. Automation Hub is a collaborative process identification, automation pipeline management, and process repository tool that accelerates the adoption of RPA across an organization, by building an RPA Community of Interest that puts the employees in the driver seats of automation initiatives.

- Once you share the idea, the concerned person needs to approve or reject or mark as duplicate in case someone has already shared this idea.



- Download the Task Capture and make sure the pop-ups are allowed in your browser.



Detailed Assessment :-

- After Task Capturing you need to assess the process in detailed way. Go to actions and edit mode and fill the details which are required.
