

PUBLISH AND RUN WORKFLOW USING ORCHESTRATOR

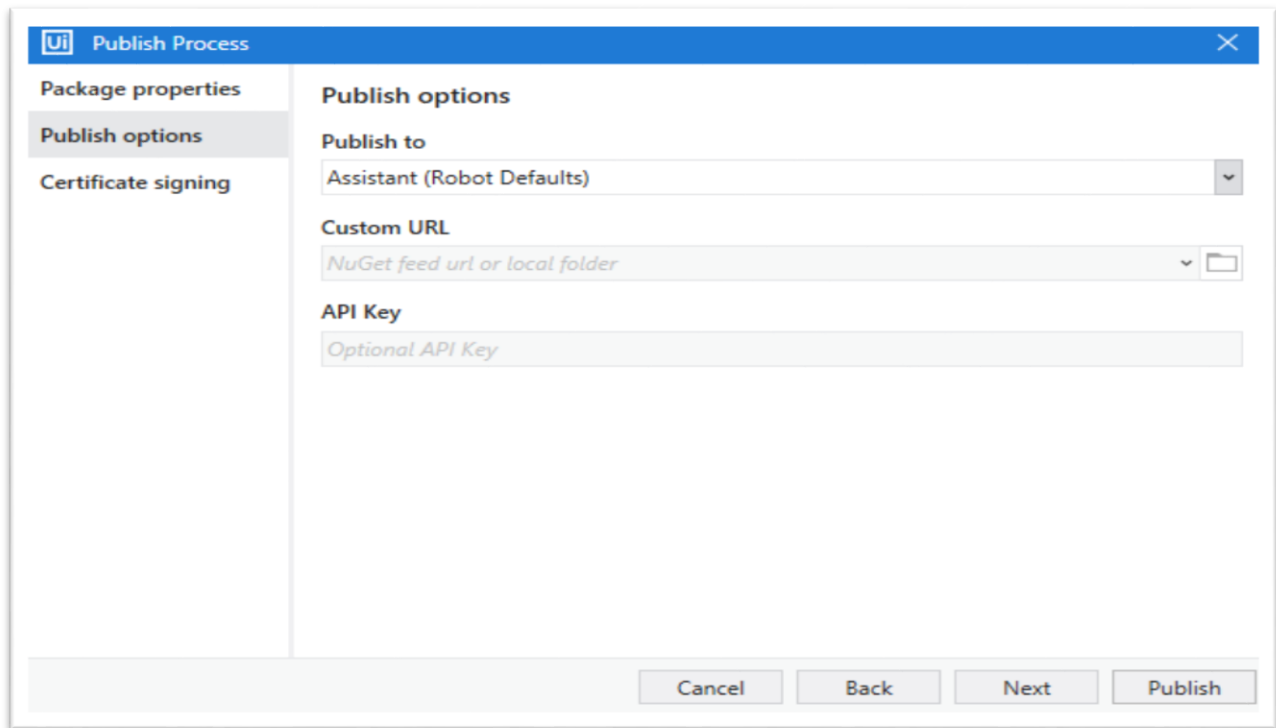

Create a simple project in UiPath Studio

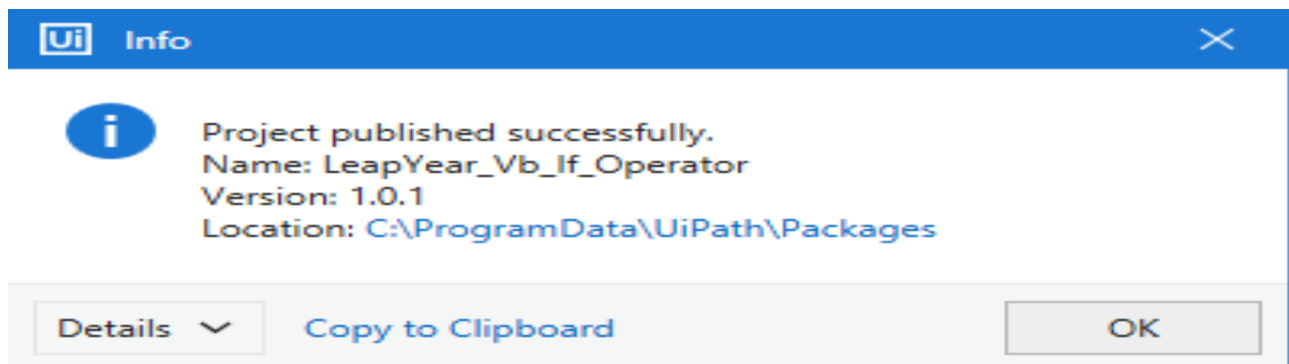

Click on publish button which on the ribbon tab the moment you click the pop up appear like this

Click on next the pop up appear like this

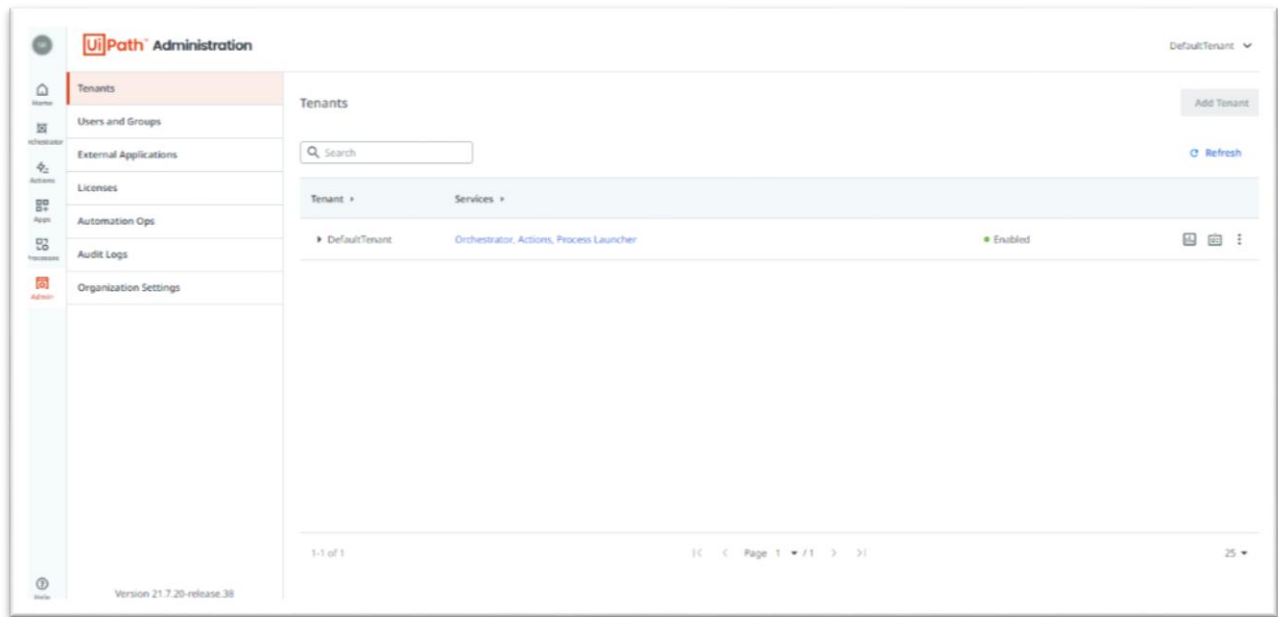

Click on publish the moment you do what happens is the particular package or the workflow has been published to the orchestrator

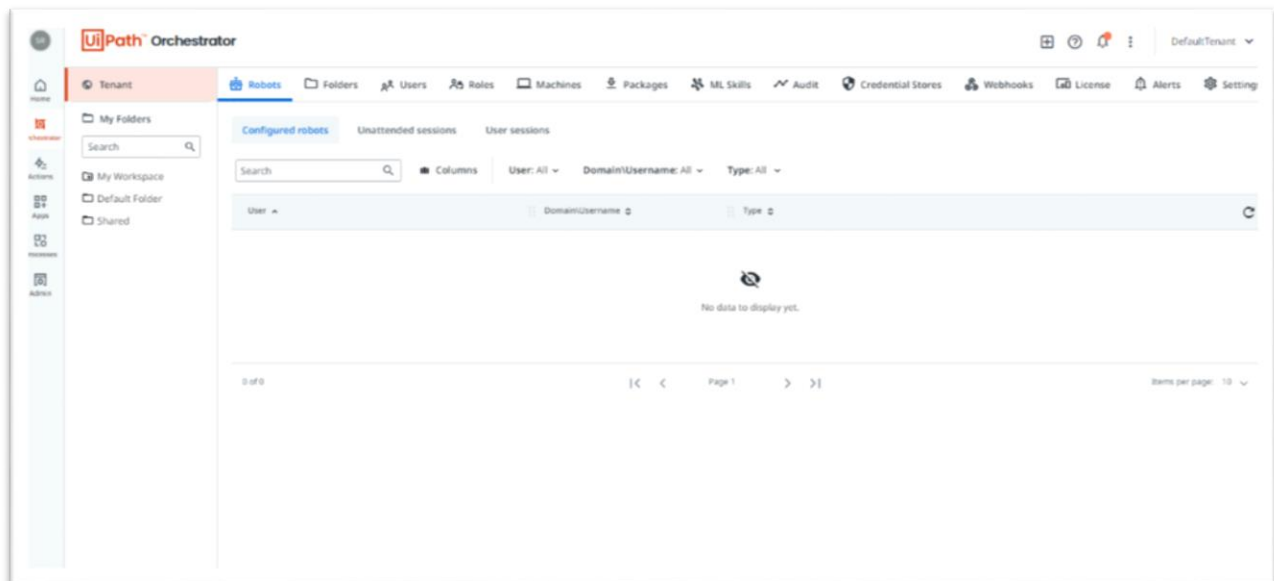

Click on ok

Next thing we have to do is Login to cloud.UiPath.com that is your home page and click on admin which is on left side and click on tenant and click on default tenant service

Once you uploaded the package you will find in Orchestrator page

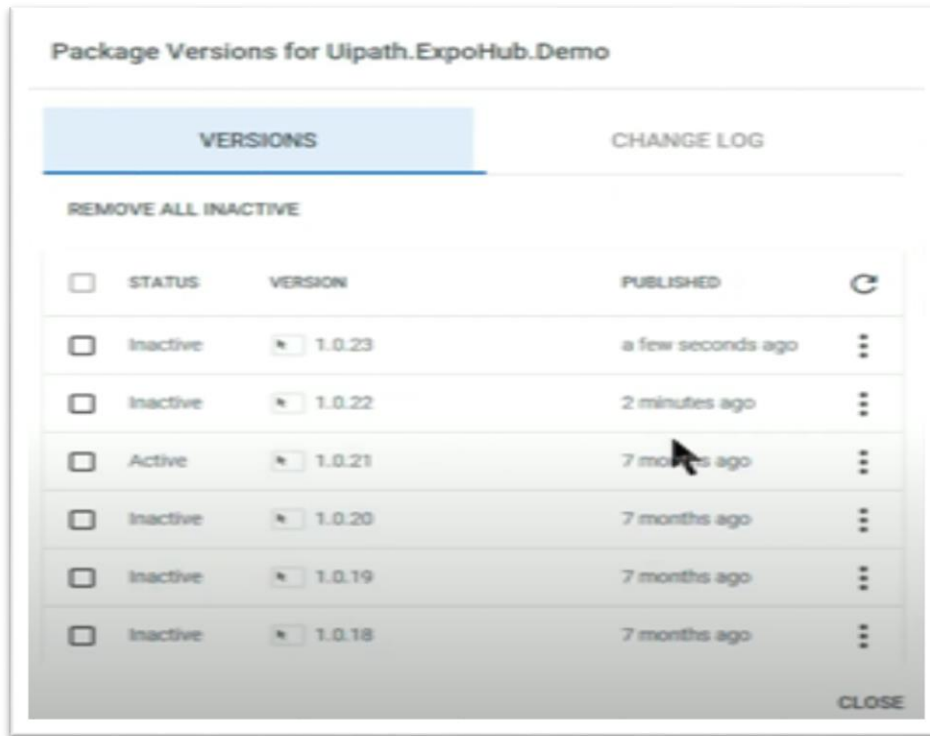

In the Orchestrator page go to tenant their you can see packages on the top

Click on packages their you will find you project/workflow you have published. Search for you project with same name and same version

First time you publish the version will be 1.0.1

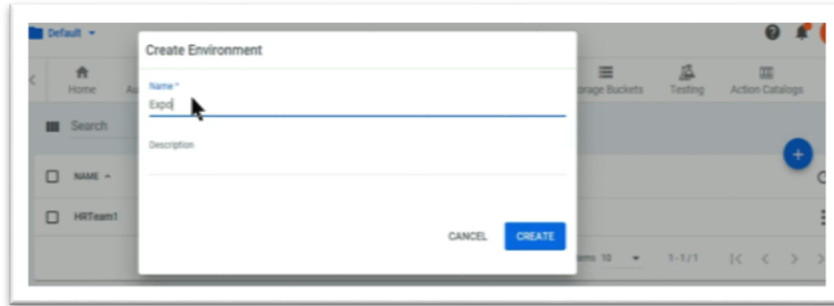

Select the project what you publish and go to more three dots and click on view version and select same version and close

Click on environment and click on plus sign and create a group say group1

What is environment?

An environment is **a grouping of Robots that is used to deploy processes**. The Environments page displays all previously created environments and enables you to manage Robots within them.

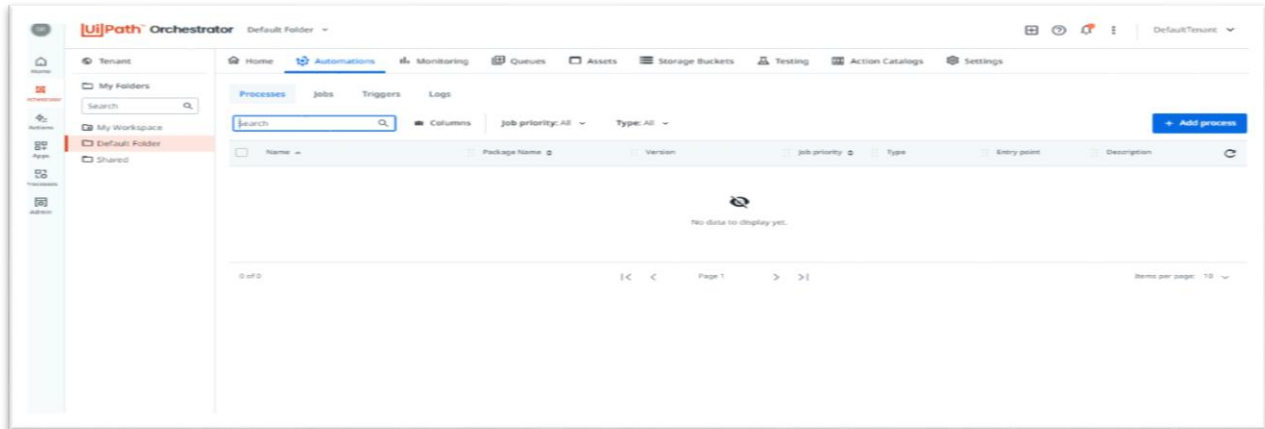

Let's say take an example there are thousand employees or one lakh employees out of that the project which you have built it is required for the hr team not for the entire company doesn't want to use it only the hr team want to use it ,So this environment is the place which would help you to create who is going to use it your project or entire company wants to use the project or group of people wants to use the project

And add robot to that group1 if you create another group say group2 and want your robot to be part of that group2 we can select our robot to be part of that group2 also and update

[How to push the project just now I have uploaded to orchestrator from orchestrator to UiPath assistance ?](#)

Click on home page click on the process and click on add process just know you uploaded to a group

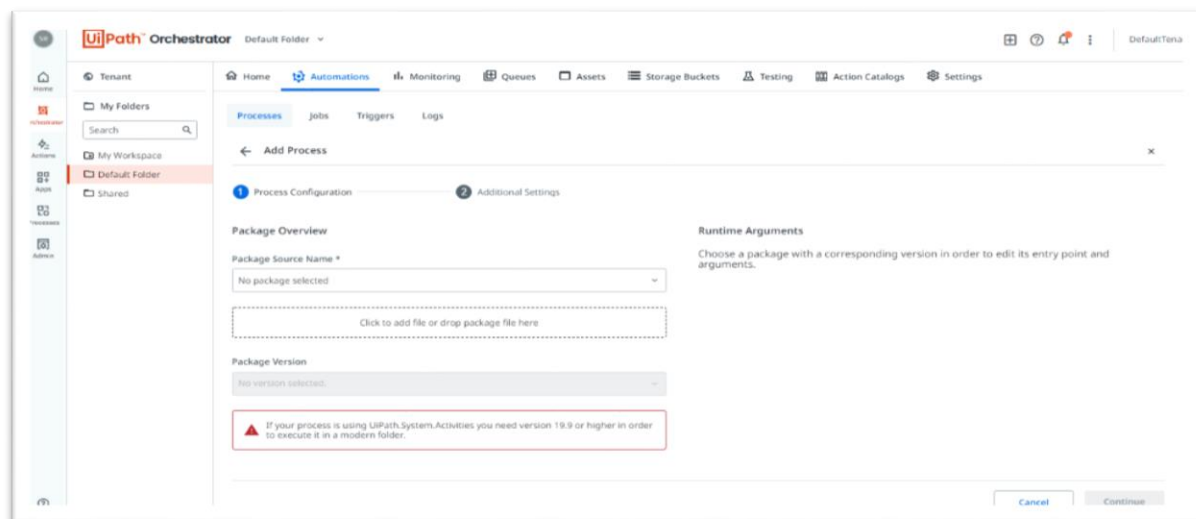

Select the same package/project

Select same version

Select environment

Environment is nothing but which group whom you want to send ,this I want to send it to group1,group2 depending on the need

Click continue

When you run project or workflow in process which is their in tenant page the project will sit in UiPath Assistant.from here the user can run the project irrespective of UiPath studio
